5. The difference in the number of waves when yellow light propagates through air and vacuum columns of the same thickness is one. The thickness of the air column is $\qquad$ mm. [Refractive index of air $=1.0003$, wavelength of yellow light in vacuum $=6000 \AA$ ]

## Sol. 2

We know
Thickness $\mathrm{t}=\mathrm{n} \lambda$
So, $n \lambda_{\text {vac }}=(n+1) \lambda_{\text {air }}$
$\mathrm{n} \lambda=(\mathrm{n}+1) \frac{\lambda}{\mu_{\text {air }}}$
$\mathrm{n}=\frac{1}{\mu_{\text {air }}-1}=\frac{10^{4}}{3}$
$\mathrm{t}=\mathrm{n} \lambda$

$$
=\frac{10^{4}}{3} \times 6000 \AA
$$

$$
=2 \mathrm{~mm}
$$

6. In the given figure the magnetic flux through the loop increases according to the relation $\phi_{B}(\mathrm{t})=10 \mathrm{t}^{2}+20 \mathrm{t}$, where $\phi_{\mathrm{B}}$ is in milliwebers and t is in seconds.
The magnitude of current through $R=2 \Omega$ resistor at $t=5 \mathrm{~s}$ is_mA.
$\times \times \times \times$

## Sol. 60

As we know induce emf
$|\epsilon|=\frac{d \phi}{d t}=20 \mathrm{t}+20 \mathrm{mV}$
$|i|=\frac{|\in|}{R}=10 \mathrm{t}+10 \mathrm{~mA}$
at $\mathrm{t}=5$
ii $=60 \mathrm{~mA}$
7. In the given figure, two wheels $P$ and $Q$ are connected by a belt $B$. The radius of $P$ is three times as that of Q . In case of same rotational kinetic energy, the ratio of rotational inertias $\left(\frac{I_{1}}{I_{2}}\right)$ will be $x: 1$. The value of $x$ will be $\qquad$ .

## Sol. 9

$\frac{1}{2} I_{1}\left(\omega_{1}\right)^{2}=\frac{1}{2} I_{2}\left(\omega_{2}\right)^{2}$
$I_{1}\left(\frac{v}{3 R}\right)^{2}=I_{2}\left(\frac{v}{R}\right)^{2}$
$\frac{I_{1}}{I_{2}}=\frac{9}{1}$
8. The water is filled upto height of 12 m in a tank having vertical sidewalls. A hole is made in one of the walls at a depth ' $h$ ' below the water level. The value of ' $h$ ' for which the emerging stream of water strikes the ground at the maximum range is m .
Sol. 6

$R=\sqrt{2 g h} \times \sqrt{\frac{(12-h) \times 2}{g}}$

$$
\sqrt{4 \mathrm{~h}(12-\mathrm{h})}=\mathrm{R}
$$

For maximum R

$$
\begin{aligned}
& \frac{\mathrm{dR}}{\mathrm{dh}}=0 \\
& \Rightarrow \mathrm{~h}=6 \mathrm{~m}
\end{aligned}
$$

9. A swimmer wants to cross a river from point $A$ to point $B$. Line $A B$ makes an angle of $30^{\circ}$ with the flow of river. Magnitude of velocity of the swimmer is same as that of the river. The angle $\theta$ with the line $A B$ should be ${ }^{\circ}$, so that the swimmer reaches point $B$.

## Sol. $3 \mathbf{0}^{\circ}$

As we know
Both velocity vectors are of same magnitude therefore resultant would pass exactly midway through them
$\theta=30^{\circ}$
10. A small block slides down from the top of hemisphere of radius $R=3 \mathrm{~m}$ as shown in the figure. The height ' h ' at which the block will lose contact with the surface of the sphere is m . (Assume there is no friction between the block and the hemisphere)

Sol. 2m

on balancing
$m g \cos \theta=\frac{m v^{2}}{R}$
$\cos \theta=\frac{\mathrm{h}}{\mathrm{R}}$
Energy conservation
$\mathrm{mg}\{\mathrm{R}-\mathrm{h}\}=\frac{1}{2} \mathrm{mv}^{2}$
From (1) \& (2) $\Rightarrow \operatorname{mg}\left\{\frac{h}{R}\right\}=\frac{2 m g\{R-h\}}{R}$

$$
h=\frac{2 R}{3}=2 m
$$
